Continuation of 3. NOTE: New issues are raised by the amendments to Claim 2 changes the scope of the claims and require further consideration. Claim 2 was amended to include the concepts of cancelled Claims 5 and 8. Claim 2 contains the step of the print job status information and the print job data stored by the host apparatus or apparatuses are sent from the host apparatus or apparatuses to the printer or printers in the resuming step. However in the original claim 8, the limitation was in the determining recovering step. By changing the occurrence of an operation in a different step changes the scope.

Continuation of 11. does NOT place the application in condition for allowance because:

Applicant alleged that Suzuki fail to teach or suggest creating the status data of each of the objects in connection with printing the objects.

The examiner will clarify the rejection previously made. The objects in Suzuki that the examiner is referring to the bands of data that the print data is divided into. Suzuki sends the bands of data from the host computer to the printer until the buffer is full. If the buffer is full then a status request is requested by the host computer to the printer. This process is shown in Suzuki, Figure 8. An error will prevent the next band of data to be printed thus causing the buffer to fill up. Suzuki did not specify the size of the buffer and how many bands are divided from the page. Suppose that the buffer can hold one band. This will cause the buffer to be full and inquire with the printer on the status, if there is no error therefore the band can be successfully printed and will the status information will be indicated of the object is indicated to the host apparatus by a empty buffer that will allow the next band to be transmitted. This is considered status information as the printed bands are now printed and this status applied to all bands of data already printed.

If there is an error, the bands of data are no longer printed thus halted and are unprinted. This information is stored until the printing of the job has completed as seen in the resolution of error in Suzuki, Column 13 and 14, require after resolution of error, sending the unprinted bands of data. Therefore the status information of each object is known and by sending the status data to the host apparatus is subsequently stored.

Applicant alleged that Suzuki does not teach or suggest selecting the unprinted objects from a plurality of objects, when the printing is to be resumed based on the status information related to the objects. The examiner respectfully disagrees. In the case of Suzuki, the objects are ordered and if the printer recovers from the error to resume printing, the object/band of data selected will be the band of data stored in the full buffer. All bands not printed due to an error are selected to be printed when the printer error is resolved. Applicant respectfully submit that the Suzuki's printer is a dumb printer that does not provide a feature which allows for the unprinted object to be stored in the host apparatus and printed when the error is recovered, as claimed. Examiner respectfully disagrees, the error occurring at the printer and due to limited buffer size of the buffer at the printer. There will be unprinted objects/bands of data at the host apparatus that will be transmitted once the printer has recovered from the error.
